 Clinical Summary & Recommendations

Patient is a 34-year-old male with well-controlled diabetes and hypertension. Lab results show elevated fasting glucose and HbA1c – suggest dietary modification and increase Metformin to 1000 mg twice daily. Lipid panel indicates high LDL; consider adding Ezetimibe or increasing Atorvastatin. Vitamin D deficiency noted – prescribe 60,000 IU weekly for 8 weeks. All other vitals and scan results are within normal limits. Follow-up in 3 months with repeat HbA1c and lipid profile.
